

# Conveyor Systems

As a leading manufacturer of Conveyor Systems we provide a fully integrated service that begins with concept design and follows all the way through to final installation.

We specialise in the design of powered roller, modular belt, incline belt, slat chain, and overhead conveyors used in a wide variety of manufacturing and distribution industries. We also design and install baggage handling systems used in airports and ferry terminals.

Our services include both mechanical and electrical installation as well as long term maintenance if required. We provide a 24hr service and a comprehensive range of spare parts from stock that includes geared motors, chains & sprockets, belts & pulleys, pneumatics, and conveyor belts.

### Bespoke Conveyors

Over many years Texam has acquired very specialist skills in the design and manufacture of Bespoke Conveyors used to convey heavy items, typically up to 20 tonnes. Our systems are used extensively in assembly line processes by manufacturers of heavy industrial goods including generator sets and fork lift trucks.

### Bespoke Materials Handling Equipment

Our design services include the design of specialised product handling equipment. These bespoke pieces of equipment are used in heavy engineering environments where product rotation and stability are key elements of the manufacturing process. Our machinery has included specialist lifting and rotation equipment.

### Modular Roller Conveyors

We act as Systems Integrators for several European conveyor component manufacturers. Using standard conveyor modules we configure conveyor systems to suit exact customer requirements. Standard modular type conveyors include gravity roller, lineshaft roller, level belt, accumulation, chain driven roller, zero line pressure and pallet conveyors. All of our systems include full technical support on product handling, system layouts, installation, maintenance and spare parts.

### Overhead Conveyors

Using modular overhead chain rail systems we can design conveyor systems to convey products at high level and then return them to lower levels running them through paint lines, box delivery systems, accumulation carousels and a wide variety of other industrial processes.

### Baggage Handling

We design, manufacture, supply and install baggage handling conveyors typically used in Airports and Ferry Terminals. These include baggage carousels, check in conveyors and weighing conveyors. We also design gravity roller systems used in hand baggage screening areas.

We provide unique solutions to production line processes that save time and money.
